Background: The pathogenesis of abdominal aortic aneurysm (AAA) involves a central component of chronic inflammation which is predominantly mediated by myeloid cells. Both, neutrophils and monocytes are recruited to the AAA wall and intraluminal thrombus and contribute to vessel destruction by the release of proteases and reactive oxygen species.

Purpose: We hypothesized that the local activation of myeloid cells may be reflected in systemic alterations of neutrophil and monocyte populations as well as in associated soluble factors which might serve as biomarkers to diagnose the often-asymptomatic disease.

Methods: The methods of this study were to establish their diagnostic marker potential, neutrophil and monocyte subsets were measured by flow cytometry in peripheral blood samples of 41 AAA patients and 38 healthy controls matched for age, sex, body mass index and smoking habit. Comparably, circulating factors relating to myeloid cell activation and recruitment were assayed in plasma by multicytokine array and ELISA.

Results: Significantly elevated levels of CD16+ monocytes, activated neutrophils and newly released neutrophils were recorded for AAA patients compared to controls. In line, the monocyte chemoattractant protein 1 and myeloperoxidase were significantly increased in patients’ plasma. The diagnostic value was highest for myeloperoxidase, a mediator which is released by activated neutrophils as well as CD16+ monocytes. Comparison of the investigated myeloid factors with established AAA parameters by multivariable logistic regression identified myeloperoxidase and D-dimer as highly significant, independent variables. These two biomarkers were combined to yield an improved diagnostic score.

Conclusions: Based on a comprehensive comparison of myeloid cell activation parameters, plasma myeloperoxidase was identified as the most potent AAA biomarker. Since D-dimer and myeloperoxidase represent two sensitive markers of AAA which reflect distinct components of the AAA pathomechanism (thrombus formation and inflammation) they may be combined to yield an improved diagnostic score.
