Women's health is a perspective of prevention and treatment that looks at health concerns unique to females. Even though slightly more than half of the US population is female, medical research historically has neglected the health needs of [women](#), other than reproductive issues. Recently there have been major changes in government and private support of [women's health](#) research in policies, regulations, and the organization of research efforts. In a recent Institute of Medicine (IOM) report, the Washington DC-based institute found that women's health research has contributed to significant progress over the past 20 years in lessening the burden of disease and reducing deaths from some conditions for women, while other conditions have seen only moderate change or even little or no change. Gaps remain, both in research areas and in the application of results to benefit women in general and across multiple population groups.

Significant progress has been made in reducing mortality for women from breast cancer, cardiovascular disease and cervical cancer. This can be attributed in part to increased consumer demand and awareness, which has resulted in additional funding and research; improved diagnosis; screening and treatment; and, in the case of cervical cancer, a vaccine.

#### Scope and Importance:

The intention of the [World Congress on Women Healthcare and Reproductive Medicine](#) is to create global awareness about the Women's Health among the world and get to know about the advanced techniques used for treatment and diagnosis of Infertility and various Reproductive disorders.
