

## A handy method to eliminate causes of autoimmune and allergic diseases

Kimihiko Okazaki

Okazaki Medical Clinic, Japan

**Keywords:** Allergy, immunology, autoimmune diseases, T lymphocytes, antibodies, receptors

**Abstract:** According to the traditional concept of the current immunology, neither autoimmune illnesses nor allergic illnesses may be cured completely. Nevertheless, a lucky twist of fate led the writer to find out a novel concept that eliminations of the causes of these diseases are possible. In other words, combos of pathogenic antibodies with accountable cells, namely, cytolytic T lymphocytes in instances of autoimmune diseases and mast cells in instances of allergic diseases, may be decomposed by means of changing the pathogenic antibodies with non-unique antibodies. In more detail, intradermal injections with a non-specific antigen preparation result in productions of nonspecific antibodies inside the body of the patient. Repetitions of the injections result in an accumulation of them.

How to make the above cited replacements take area is repeated intradermal injections with non-particular antigen preparations.

Approximately six many years ago, all of allergic illnesses are caused by combinations of allergen-unique antibodies and mast cells. And Equilibrium states exist among antibody molecules in the location in their receptors on the floor of leucocytes. In my opinion, which took place to me incidentally, an extremely beneficial factor of view may be delineated. An clarification of above-referred to equilibrium is that every antibody molecule keeps attaching to and detaching from its receptors. Another clarification of the identical is that each receptor continues changing antibodies. After a enough wide variety of repetitions of the above-cited injection, a massive range of non-unique antibodies are accumulated. Then, definitely no pathogenic antibody remains attached to the receptors. Namely, disease-causes get eliminated.

### Introduction:

The so-known as routine procedures of number one take care of allergic diseases that are presently carried out are prescriptions of anti-allergic medicines. On the opposite hand, a novel idea concerning life of equilibrium states amongst antibody molecules inside the area of the receptors turned into proposed as early as in 1959 and has been set up around the end of the 20th century. It is obvious that some other novel idea can be deduced from the concept stated above. Namely, antibody molecules' mutual exchanges are occurring all the time. In more detail, all of antibody molecules inside the place of the receptors keep attaching to and detaching from the receptors. In other words, antibodies' replacements are occurring all the time. In addition, if allergen-particular antibodies had been replaced with the aid of non-unique antibodies, reasons of allergic diseases could be eliminated. It is obvious that removal of cause of sickness is an ideal treatment. In addition, the correct treatment may be performed extremely easily. In more detail, all you want to do is to inject your patient intradermally with a non-specific antigen training. Further rationalization could be that the injected non-specific antigen will force the patient produce nonspecific antibodies, which in turn replace allergen-specific antibodies from the surface of mast cells. An instance of non-unique antigen training is Neurotropin, a made of Nippon Pharmaceutical Company, LTD (Osaka) together with extracts of rabbit skin inflamed by using inoculation of Vaccinia virus

A revolutionary concept, which enables you to get rid of causes of immunological illnesses, is verified. According to the traditional idea of the modern-day Immunology, neither autoimmune sicknesses nor

allergic illnesses can be cured completely. Nevertheless, a fortunate coincidence led the writer to discover a novel idea that eliminations of the causes of those diseases are possible. In other words, combos of pathogenic antibodies with responsible cells, namely, cytolytic T lymphocytes in instances of autoimmune illnesses and mast cells in cases of allergic sicknesses, may be decomposed by using replacing the pathogenic antibodies with non-specific antibodies. In extra detail, intradermal injections with non-particular antigen guidance induce productions of non-specific antibodies in the body of the affected person. Repetitions of the injections result in an accumulation of them. Accumulated non-particular antibodies will occupy most of the receptors at the surface of accountable cells. When the build-up reaches the sufficient level, actually no pathogenic antibodies might stay on the receptors. That is, no causes of the illnesses continue to be.

It is properly installed that the etiology of allergic diseases is that combinations of mast cells and allergen-particular antibodies purpose allergic symptoms while the sufferers meet allergens. Similarly, the etiology of autoimmune diseases is that combinations of cytolytic T lymphocytes and organ-particular antibodies motive damage of the organ. A most plain concept could be that ruin down of the above-stated combinations must bring about disappearance of reasons of the diseases. To exercise session the above cited concept, it's far vital to have the patients make non-unique antibodies for themselves. In order for the patients to do so, they need to receive intradermal injections with non-specific antigen preparations. Consequently, non-particular antibodies collect within the sufferers' bodies, which may update unique antibodies from respective cells bringing about removal of reasons of the sicknesses. Needless to mention, where there's no purpose, there may be no disease. Details are tested elsewhere. The conceptual foundation of antibodies' mutual alternate is life of equilibrium state among antibody molecules within the area of receptors, which changed into first proposed by way of Porter. One of the present day trends concerning remedies of immunological sicknesses is an intravenous infusion of solution of non-unique antibody training. However, a big wide variety of those infusions are dangerous due to the fact anti-antibody antibody might be produced within the recipient's body, which may motive an anaphylactic reaction.

### Case 1

A 53-year-antique woman (M.M.) visited my hospital on December 2, 2016. She told me that she had had a intense pain within the third toe of her left foot on August 24, 2016. She also informed me that she had obtained diagnosis of rheumatoid arthritis at a local sanatorium. I gave her intradermal injections with 0.1ml of 10 to the 30- fold diluted Neurotropin; a made from Nippon Pharmaceutical Company (Osaka), along with an extract of rabbit skin inflamed via inoculation of Vaccinia virus, at her navel-area at 1~10 day intervals all through the period from December 2, 2016 till May 12, 2017. The total range of injections became 31. She has had cedar and cypress pollen-allergy in view that her youth. She is completely recovered from each of the sicknesses as of August 16, 2017.

### Case 2

A 55-year-vintage man (H.M.) visited my clinic on March 10, 2017. He instructed me that he had nephrotic syndrome in 1997 and spent 6 months in a health facility therefor receiving drip-infusion with steroid hormone every day. He also advised me that his rheumatoid

arthritis began in 2011 and in the course of the period from April, 2012 till March, 2013, he turned into incapable of walking because of extreme pains in both foot joints. I gave him intradermal injections with 0.1 ml of 10 to the 28-fold diluted Neurotropin on the navel facet at 2~7 day intervals all through the length from March 10, 2017 to April 21, 2017. The overall quantity of the injections becomes 10. He is unfastened from any signs and symptoms as of August 16, 2017.
