

A Study of Prevention to Virus Communication in the Human Society

Krishna G Pandey
CCS University, India

Abstract

Nowadays many diseases are increasing due to virus infection in the world. Because of this, infections like the Spanish flu, Cholera, Smallpox, Whooping Cough etc. are coming from the old times. But nowadays a new virus has arrived, named Novel Corona virus due to which Covid-19 is spreading an infectious disease.

This infection spreads from person to person. In earlier times it was heard that due to infection, all the people of the village and the city would die. Due to this, villages in villages used to be empty.

But later the vaccine has been prepared for their prevention, which has prevented these epidemics to a great extent. But along with these vaccines, humans have to correct their habits along with their prevention like personal health, good habits, hygiene, exercise, yoga, balanced diet and immunity etc. The society will also have to be made aware of social evils like superstitions, caste, etc. Only then can we prevent epidemic infection.

In the presented study, the researcher has worked on the above points of prevention. nudicaulis
