

# As patients recover from an exacerbation-related hospital stay, the proportion of acute cardiological events in those with chronic obstructive pulmonary disease is assessed

Ourania S. Kotsiou

University of Thessaly, Greece

## Abstract

**Aims and Objectives:** Patients with chronic obstructive pulmonary disease (COPD) more frequently have cardiovascular comorbidity than healthy individuals. The impact of cardiovascular events on COPD patients during the recovery period after an exacerbation-related hospitalization remains poorly studied. This study aimed to evaluate the prevalence of acute cardiac events in COPD patients during the recovery period after an exacerbation-related hospitalization through remote monitoring.

**Methods:** ZENSOR devices (INTELESENS Ltd) and m-health system, a 24-hour recording system of three biosignals (electrocardiogram, heart and breath rates) were implemented for 21 days in COPD patients hospitalized in the Respiratory Medicine Department, University of Thessaly, Greece from September 2019 to February 2020.

**Results:** 18 COPD patients participated in the study. 83% of them were male (mean age: 73±6 years). 39% of the patients had stage III/IV disease and received home oxygen therapy. 95% had 3±1 comorbidities. 28% of patients had chronic coronary heart disease and 22% had chronic atrial fibrillation. 9072 recording hours were analyzed. Regardless of the COPD stage, half of the patients, developed first-diagnosed arrhythmological events that required therapeutic intervention. 11% of patients had persistent episodes of ventricular trigeminy, 11% presented a third-degree atrioventricular block, 27% had persistent bradycardia, and 5% had acute atrial fibrillation. 11% and 44% of patients experienced episodes of supraventricular tachycardia and premature ventricular contractions during sleep, respectively. 89% of the participants reported that they were satisfied with the use of the device.

**Conclusions:** Sensor device effectively diagnose arrhythmological events that required medical intervention in patients with COPD during the recovery period after an exacerbation-related hospitalization.

## Biography

Dr. Ourania Kotsiou is 36 years old. She is Assistant Professor on Human Pathophysiology in the Nursing Department, University of Thessaly, Greece. She holds a Ph.D. in pleural pathophysiology from the University of Thessaly. She was licensed as a Respiratory Physician in 2017. Since then, she has been serving as principal investigator in several funded Research Programs at the University of Thessaly. With four

years of research background, she gained considerable expertise to identify scientific knowledge gaps and clinical research priorities. She has published more than 50 papers in reputed journals and serves as an editorial board member of reputed.
