

## Childhood Strain Linked to a Major Failure Later in Life: A Short Commentary

Taylor Dumas

Department of Psychology, Stetson University, USA

### Abstract

The objective of this study is to evaluate the relationship between childhood trauma and the likelihood of suicide during the pressure test. The correlation was maintained even when the effects of the BAS and BDS scores were excluded. At the end of our study, childhood traumas were associated with symptoms of depression. In the group with childhood traumas, increased suicide during the before and after the test or examination, the present study suggest that children in trauma needs the special attention from the primary socialization in the child development.
