

Comparative evaluation of role of oro-t mouthwash and smf mouthwash as adjunct to scaling (subgingival irrigation): A randomized clinico-comparative study

Shruti Dabi

Rajasthan University of Health Science, India

Abstract

Treatment of periodontal disease is routinely based on mechanical debridement of the tooth surface and appropriate and meticulous maintenance of oral hygiene. However, comprehensive mechanical debridement of sites with deep periodontal pockets is difficult to accomplish, therefore systemic or local administration of antibiotics are preferred. But there are various disadvantages with systemic therapy like hypersensitivity reaction, organ toxicity and bacterial resistance. So, to attain the correct required GCF concentration at the target site, led to the use of local drug-delivery system. Ayurveda system of medicine has its root in Indian subcontinent which is being globalized and practices as alternative medicine in the Western world. It is typically based on complex herbal compounds, minerals, and metal substances. Further SMF mouthwash has been used for treating OSMF patient because of its contents which enhanced its properties by improving healing capacity of the tissue. So, in this present study we have planned to evaluate & compare healing potential of both the mouthwashes which is better.
