

## Construction and evaluation of advanced nursing practice course for postgraduate students in nursing

Yuan-yuan Song<sup>1</sup>, Xiao-lian Jiang<sup>2</sup>

Sichuan University, China

### Abstract.

In China, nursing postgraduate education started relatively late, without a systematic and a unified core knowledge system, each school has its own curricula, and nursing-specific courses are limited. Many schools are still using clinical medicine specialized courses as their major courses, only a few schools have established courses related to advanced nursing practice. Our school developed a course named “advanced nursing practice” in the fall of 2017, 33 students chose the course. Students’ perception and evaluation of the course content, teaching methods, teaching quality and course value was collected, the problems existing in the course contents and teaching methods were discussed.

Most of the students had very positive feedback on the course and thought it so necessary and useful that they could know more about theories and methods of advanced nursing practice and the development status, evidence-based practice, trends of development of the 12 nursing specialties involved in the course. In addition, teamwork, critical thinking as well as evidence-based practice abilities of the students were improved. The students also developed a better understanding of nursing career and said the course is helpful for their future occupational planning. The overall satisfaction about the course content, teaching method, and the evaluation was high.

The content, teaching method and evaluation mode of the course was creative and a satisfactory effect was achieved. The course could provide a reference for construction of related courses in domestic nursing colleges and universities in China.

mentor’s assistant to set up this course, collect students’ feedback and analyze data.
