# Design and synthesis of substituted clubbed triazolyl thiazole as XDR \& MDR antituberculosis agents 

Dinkar Mundhe*, A. V. Chandewar, Mahendra R. Shiradkar<br>Chemical Biology Program, Laboratory of Drug Design and Discovery, P. Wadhwani College of Pharmacy, Yavatmal, Maharashtra, India

#### Abstract

The emergence of $X D R \& M D R$ tuberculosis have forced medicinal chemist to think out of the box to arrive at promising "Hit". Here is the report which, suggest our attempt to discover a clubbed thiazolyl-triazole molecule that has shown potency almost comparable with isoniazid. Further evaluation with almost 25 XDR \& MDR clinical isolates of tuberculosis suggest better profile of drug candidate than reference drug, isoniazid. The candidate is under further development status and is showing promising activity with lesser toxicity.

Key words: XDR, MDR, tuberculosis, triazole, thiazole.

## INTRODUCTION

Almost 2 millions of lives annually are claimed by Mycobacterium tuberculosis (MTB), the etiological agent of tuberculosis (TB), and is still on the rise. The use of two antimicrobials, pyrazinamide \& rifampicin in the 1960s have revolutionised the antimycobacterial therapy. And now in combination with isoniazid, ethambutol and/or streptomycin, this therapy represents a landmark in the treatment of human tuberculosis and resulted in the implementation of shortcourse chemotherapy (SCC), reducing the time of treatment from 18 to 6 months [1-3]. SCC contributed towards controlling tuberculosis burden for the next 20 years. Shockingly, tuberculosis cases started to rise again in the 1990s under the pressure of the HIV pandemic and the emergence of multidrug-resistant (MDR) and extremely drug-resistant (XDR) tuberculosis strains. MDR strains are resistant to at least isoniazid (INH) and rifampicin (RIF), whereas XDR strains are MDR isolates that are additionally resistant to fluoroquinolones and to one of the three injectable drugs capreomycin, amikacin and kanamycin. The emergence and dissemination of MDR and XDR isolates, estimated to account for more than 400,000 new cases per year, impart new challenges in tuberculosis control [4]. Indeed, current treatment of drug-resistant tuberculosis requires 18-36 months and is associated with an unacceptable rate of treatment failure and relapse. Consequently, developing new compounds active against MDR and XDR tuberculosis constitutes a main objective in anti-tuberculosis drug discovery. In addition, new antimycobacterial agents should ideally contribute to shorten tuberculosis treatment to 2 months
or less [5, 6]. Few promising drug candidates fulfilling these criteria have been discovered in recent years [7-9]. Nonetheless, given the number of tuberculosis cases and the rate of emergence of drug resistance, more compounds are clearly needed to combat and have a significant impact on the control and spread of tuberculosis. Thus as a part of our in-house antimycobacterial program, we herein report the synthesis and activity of new "Hit" molecule of our lab.

## MATERIALS AND METHODS

### 2.1. Chemistry

${ }^{1} \mathrm{H}$ NMR spectra were recorded on a Bruker Avance 300 MHz instrument using TMS as internal standard; the chemical shifts ( $\delta$ ) are reported in ppm and coupling constants ( $J$ ) are given in Hertz. Signal multiplicities are represented by s (singlet), d (doublet), $t$ (triplet), ds (double singlet), dd (double doublet), $m$ (multiplet), and bs (broad singlet). Mass spectra were recorded on a Finnigan LCQ mass spectrometer. Microwave irradiation was carried out in Raga Scientific Microwave Systems, Model RG31L at 2450 MHz . Elemental analysis was performed on a Heracus CHN-Rapid Analyser. Analysis indicated by the symbols of the elements of functions was within $\pm 0.4 \%$ of the theoretical values. The purity of the compounds was checked on silica gel coated Al plates (Merck).
2.1.1. Preparation of N-(5-(4-((4-Amino-5-mercapto-4H-1,2,4-triazol-3-yl)methyl)-5-methylthiazol-2-yl)pyrimidin-2-yl)benzamide (9).
Above titled compound was prepared as per the reported method of chemo-transformation. [1012].

### 2.1.2. General preparation of N-(5-(4-((4-Substituted-amido-5-mercapto-4H-1,2,4-triazol-3-yl)methyl)-5-methylthiazol-2-yl)pyrimidin-2-yl)benzamide 10.

The triazole 9 ( 1 mmol ) was dissolved in 20 ml of $10 \%$ sodium hydroxide and then drop wise equimolar amount of the 4 -chlorobenzoyl chloride was added to the reaction mixture at $0{ }^{\circ} \mathrm{C}$. The reaction mass was then stirred for $30-45 \mathrm{~min}$. At the end of stirring, precipitate was observed. It was then filtered, washed thoroughly with water and crystallized to furnish $\mathbf{1 0}$.
2.1.2.1. $N$-(5-(4-((4-Acetamido-5-mercapto-4H-1,2,4-triazol-3-yl)methyl)-5-methylthiazol-2-yl)pyrimidin-2-yl)benzamide (10a).
Yield $71 \%$; mp $284-286{ }^{\circ} \mathrm{C} ;{ }^{1} \mathrm{H}$ NMR ( $300 \mathrm{MHz}, \mathrm{CDCl}_{3}$ ): $\delta 2.04\left(\mathrm{~s}, 3 \mathrm{H}, \mathrm{CH}_{3}\right), 2.30(\mathrm{~s}, 3 \mathrm{H}$, $\mathrm{CH}_{3}$ ), $3.16(\mathrm{~s}, 1 \mathrm{H}, \mathrm{SH}), 3.81\left(\mathrm{~s}, 2 \mathrm{H}, \mathrm{CH}_{2}\right), 7.60-8.03(\mathrm{~m}, 5 \mathrm{H}, \mathrm{ArH}), 9.06(\mathrm{~s}, 2 \mathrm{H}$, pyrimidineArH ), 9.17 (bs, 2H, NH); MS m/z (\%) 468 (M+, 100), 434 (80), 427 (52), 373 (33.8), 296 (17), 268 (9.8), 280 (14.7), 289 (29.8), 246 (9.3), 220 (10.8), 164 (10.1), 98 (15.1), 85 (5.3); Anal. ### 2.1.3. General preparation of 11.

The triazole $10(1 \mathrm{mmol})$, diiodomethane $(1.5 \mathrm{mmol})$ and potassium hydroxide $(1 \mathrm{mmol})$ were dissolved in 20 ml of dichloromethane. To the said mixture acidic alumina ( 20 g ) was added. Dichloromethane was evaporated invacuos, and mixture was kept inside the alumina bath and irradiated for $5-6 \mathrm{~min}$ at the power level of 300 W . The mixture was cooled. The solid thus separated was recrystallised in hot ethanol.
2.1.3.1. $\quad N, N^{\prime}$-(5,5'-(4,4'-(5,5'-Methylenebis(sulfanediyl)bis(4-acetamido-4H-1,2,4-triazole-5,3-diyl))bis (methylene)bis(5-methylthiazole-4,2-diyl))bis(pyrimidine-5,2-diyl))dibenzamide 11a.
Yield $84 \%$; mp $266-268{ }^{\circ} \mathrm{C}$; ${ }^{1} \mathrm{H}$ NMR ( $300 \mathrm{MHz}, \mathrm{CDCl}_{3}$ ): $\delta 2.04\left(\mathrm{~s}, 6 \mathrm{H}, \mathrm{CH}_{3}\right), 2.30(\mathrm{~s}, 6 \mathrm{H}$, $\left.\mathrm{CH}_{3}\right), 3.81\left(\mathrm{~s}, 4 \mathrm{H}, \mathrm{CH}_{2}\right), 4.57\left(\mathrm{~s}, 2 \mathrm{H}, \mathrm{S}-\mathrm{CH}_{2}-\mathrm{S}\right), 7.60-8.03(\mathrm{~m}, 10 \mathrm{H}, \mathrm{ArH}), 9.06(\mathrm{~s}, 4 \mathrm{H}$, pyrimidine- ArH ), 9.17 (bs, 4H, NH); MS m/z (\%) 946 (M+, 100), 865 (73), 716 (54.6), 501 (34.2), 473 (30), 372 (10.4), Anal. 2.1.5. General preparation of N-(5-(4-((4-Substituted-amido-5-(2-hydrazinyl-2-oxoethylthio)-4H-1,2,4-triazol-3-yl)methyl)-5-methylthiazol-2-yl)pyrimidin-2-yl)benzamide 14.
A solution of triazole $\mathbf{1 0}(1 \mathrm{mmol})$, sodium hydroxide ( 1 mmol ) and methyl bromoacetate ( 1 mmol ) was prepared in dichloromethane. To this, acidic alumina was added in 1:5 equivalent of triazole. The reaction mixture was mixed, DCM was evaporated and mixture was kept inside the alumina bath and irradiated for $4-5 \mathrm{~min}$ at the power level of 300 W . The mixture was cooled and poured on ice. The solid thus separated was extracted with hot ethanol, filtered. After cooling, filtrate gave almost pure product 13.

A solution of compound $\mathbf{1 3}(1 \mathrm{mmol})$ with $5 \mathrm{ml}(1 \mathrm{mmol})$ hydrazine hydrate ( $98 \%$ ) was prepared in 10 ml ethanol. To this acidic alumina ( 10 g ) was added. Ethanol then was evaporated invacuo, and mixture was kept inside the alumina bath and irradiated for 5-6 min at the power level of 300W. The mixture was cooled and the product was extracted with ether. Ether was distilled off and product thus obtained was crystallized to give pure 14.

2.1.6. General preparation of N-(5-(4-((4-Substituted-amido-5-(2-(2-acylhydrazinyl)-2-oxoethylthio)-4H-1,2,4-triazol-3-yl)methyl)-5-methylthiazol-2-yl)pyrimidin-2-yl)benzamide 15.
To a solution of compound $\mathbf{1 4}(1 \mathrm{mmol})$ in dry dichloromethane (excess amount), appropriate acid chloride ( 1 mmol ) was added drop-wise with constant vigorous stirring. After 25 min of stirring, acidic alumina ( 10 g ) was added. Dichloromethane then was evaporated invacuo, and mixture was kept inside the alumina bath and irradiated for 5-6 min at the power level of 300W. The mixture was cooled and the product was extracted with ether. Ether was distilled off and product thus obtained was crystallized from n-hexane-carbon tetrachloride mixture. Note: After the reaction is over, keep the microwave door open for at least 1 h before initiating another reaction in order to avoid side reactions with the fumes of other acid chloride.

2.1.8. General preparation of N-(5-(4-((4-Substituted-amido-5-((4-amino-5-mercapto-4H-1,2,4-triazol-3-yl)methylthio)-4H-1,2,4-triazol-3-yl)methyl)-5-methylthiazol-2-yl)pyrimidin-2-yl)benzamide 17.
The compound $\mathbf{1 4}(1 \mathrm{mmol})$ was dissolved in alcoholic potassium hydroxide ( 1 mmol ) and kept for stirring. Carbon disulphide ( 1.5 mmol ) was added drop wise to this solution with stirring. Thick solid mass was obtained, to which 50 ml of absolute alcohol was added. Stirring was continued for 16 h . At the end of $16^{\text {th }} \mathrm{h}$, dry ether was added to the mixture. The precipitate (thiocarbazate) obtained was taken immediately for the next step.

A solution of thiocarbazate ( 1 mmol ) with hydrazine hydrate ( 1 mmol ) was prepared in 10 ml ethanol. To this acidic alumina ( 10 g ) was added. Ethanol then was evaporated invacuo, and mixture was kept inside the alumina bath and irradiated for $5-6 \mathrm{~min}$ at the power level of 300W. The mixture was cooled and poured on ice and pH was adjusted to 2-3 with (1:1) HCl :water. The
solid thus separated was filtered, extracted with ether, ether was distilled off and product thus obtained was purified to offer 17.

### 2.2. Antimycobacterial activity

### 2.2.1. Strains and growth conditions

M. tuberculosis H37Rv (ATCC, cat. no. 27294), derivative strains and clinical isolates were maintained in Middlebrook 7H9 broth medium supplemented with $0.2 \%$ glycerol, $0.05 \%$ Tween 80 and $10 \%$ ADS supplement. Culture media were supplemented with hygromycin ( $50 \mu \mathrm{~g} \mathrm{ml}^{-1}$ ) or kanamycin ( $20 \mu \mathrm{~g} \mathrm{ml}^{-1}$ ) when required.

### 2.2.2. High-throughput cell-based screen

M. bovis BCG was cultured to an $\mathrm{OD}_{600}$ of $0.5-0.6$ in complete 7 H 9 broth medium. In preparation for 1536 -well dispensing, the culture was diluted to an $\mathrm{OD}_{600}$ of 0.01 using complete 7 H 9 media. A volume of $4 \mu \mathrm{l}$ of complete 7 H 9 media was dispensed into a white, solid bottom 1536-well plate using a custom Bottle Valve liquid dispenser (GNF). A volume of 100 nl of test compound in DMSO ( 1 mM ) was then transferred into each assay plates using a custom 1536 Pintool (GNF). Diluted culture ( $4 \mu \mathrm{l}$ ) was subsequently added to the assay plates using a Bottle Valve liquid dispenser (final $\mathrm{OD}_{600}$ in $8 \mu \mathrm{l}$ is 0.005 ). The plates were incubated at $37^{\circ} \mathrm{C}$ for 48 h . Growth was assessed by measuring ATP levels using the BacTiter-Glo Microbial Cell Viability Assay (Promega). Luminescence was measured using a ViewLux plate reader.

### 2.2.3. MIC $_{50}$ determination

$\mathrm{MIC}_{50}$ were determined as previously described, with slight modifications [13]. Briefly, compounds dissolved in $90 \%$ DMSO were twofold serial-diluted in duplicates and spotted by mosquito HTS (TTP LabTech) to 384-well clear plates, resulting in 10 dilutions of each
compound. A volume of $50 \mu \mathrm{l}$ of M . tuberculosis culture (final $\mathrm{OD}_{600}$ of 0.02 ) was added to each well, and the assay plates were incubated at $37^{\circ} \mathrm{C}$ for 5 days. $\mathrm{OD}_{600}$ values were recorded using a SpectraMax M2 spectrophotometer, and MIC $_{50}$ curves were plotted using GraphPad Prism 5 software. Under the assay setting, $\mathrm{MIC}_{50}$ values, which fall in the linear part of the inhibition curve, are more robust and reproducible than $\mathrm{MIC}_{90}$. Therefore, only $\mathrm{MIC}_{50}$ values are reported. Clinical isolates used in drug susceptibility testing were strain typed by IS6110 analysis as described [14].

### 2.2.4. Cytotoxicity

Cytotoxicity was tested against cell lines HepG2 (ATCC, cat. no. HB-8065) and BHK21 (ATCC, cat. no. CCL-10) in 96 -well microplates. The cells were seeded at a density of 105 cells per well, incubated at $37{ }^{\circ} \mathrm{C}$ for 24 h and exposed to twofold serial-diluted compounds for 3 days. Cell viability was monitored using the Cell Proliferation Kit II (Invitrogen).

### 2.2.5. Determination of intracellular ATP levels

The intracellular ATP level was quantified as previously described [15]. Briefly, $25 \mu \mathrm{l}$ of $M$. tuberculosis culture was mixed with an equal volume of freshly prepared BacTiter-Glo reagent in white 384 flat-bottom plates and incubated in the dark for 5 min . Luminescence was measured using a Tecan Safire ${ }^{2}$ plate reader.

### 2.2.6. Drug preparation

Unless specified, all the compounds were obtained from Sigma and were prepared in sterile deionized water. The experimental compounds were prepared in dimethyl sulphoxide (Sigma) for in vitro drug susceptibility testing.

## RESULTS AND DISCUSSION

### 3.1. Chemistry

The chemo-transformation which lead to the synthesis of $\mathbf{9}$ was performed as per the reports [1012]. Compound 9 was treated with different acid chlorides at $0^{\circ} \mathrm{C}$ to yield 10a-c (Figure 1). The transformed compounds 10a-c were used as a lead compounds for analog synthesis. The 10a-c on treatment with diiodomethane in the presence of strong alkali i.e. sodium hydroxide gave 11a$\mathbf{c}$ which were found as stable dimer of 10a-c (Figure 3). Later on compounds 10a-c were treated with chloroacetonitrile, which on neutralization with sodium carbonate gave a precipitates of compounds 12a-c (Figure 4). Also, compounds 10a-c, when treated with methyl bromoacetate in basic condition produced 13a-c, which in-turn, under influence of hydrazine hydrate transformed to 14a-c (Figure 5). The synthesised compounds 14a-c were then treated with appropriate acid chlorides to furnish 15a-i (Figure 6). It was observed that these reactions when carried out in microwave, fumes of one acid chloride participate in next reaction if sufficient vapour clearance time is not allotted to clear off the vapours. Schiff bases, the condensation products of 14a-c, were synthesized by treating them with benzaldehyde and confirmed by absence of triplet of NH of hydrate (Figure 7). Compounds 14a-c were then converted to thiocarbazate salts by treatment with carbon disulphide and potassium hydroxide, and then treated with hydrazine hydrate to give 17a-c (Figure 8). The NMR spectra confirmed formation of triazole derivative from hydrazide, which shows presence of sulfhydryl proton at near $\delta 3.1$.

### 3.2. Antitubercular activity

A cellular screen was developed to identify mycobacterial growth inhibitors. The screen was carried out against $M$. bovis BCG using intracellular ATP content as a surrogate marker of bacillary growth. Compound hits with confirmed activity against $M$. tuberculosis were
chemically clustered to identify any emerging SAR. Our attention was drawn to a cluster of clubbed compounds comprising three major compounds, 10a, 10b \&10c (synthesised at our laboratory for CDK5/p25 inhibitory program, unpublished) with an $\mathrm{MIC}_{50}$ ranging from 0.14 to $>0.19 \mu \mathrm{M}$ (Table 1).

Figure-1: Route of synthesis for the compounds 10a-c.

Figure-2: Route of synthesis for the compounds 11a-c.

Figure-3: Route of synthesis for the compounds 12a-c.

Figure-4: Route of synthesis for the compounds 14a-c.

Figure-5: Route of synthesis for the compounds 15a-i.

Figure-6: Route of synthesis for the compounds 16a-c.

Figure-7: Route of synthesis for the compounds 17a-c.

The compounds were bactericidal and the cytotoxic profile was within an acceptable range. Therefore, a lead optimization programme was initiated with the goal of achieving potent antitubercular activity.

The program of chemo-transformation initiated with compounds 10a, 10b \& 10c. Initially a raw thought stroke us which involved dimerisation of the "Hit" compounds. Although the Lipinski rule of five does not allow these modifications, but not all the inventions follow the rule. Thus taking odd step, we have synthesised the dimer compounds 11a, 11b \& 11c. To our disappointment none of them were better than the "Hits". We postulate the labile $\mathrm{S}-\mathrm{CH}_{2}-\mathrm{S}$ bond breakage which may lead to ionic compound which may be representative of the parent compound. Thus it was thought to increase the alkyl chain with a cyano at end to check if they
prove to be cytotoxic for bacterial cells. This led us to the synthesis of 12a-c. As expected these compounds were active but were cytotoxic too.

Thus it was thought to increase the length, have a nitrogen but not in the form of cyano, but amino/hydrazide. To our imagination, these compounds $\mathbf{1 4 a}-\mathbf{c}$ have shown comparable results to their parent with less to no cytotoxicity. Thus to check if the activity may increase we have reacted them with acid chlorides and synthesised 15a-i. None of them, surprisingly turned out to be active. It may be topic of research as why only a small change led to such a vast different activity. As the Schiff bases reported to have their antibacterial activity and are also reported to help in penetration, we then synthesised 16a-c. To our surprise, 16a emerged as a hit which is almost equipotent to isoniazid and without any notable cytotoxicity. Other compounds $\mathbf{1 6 b}$ \& 16c have also shown better activity but have also shown some cytotoxicity. Then we further went for hetercyclisation which gave 17a-c, which on contrary to our expectations, none of the compound was as promising as 16a.

Table 1: Preliminary Structure Activity Relationship of compounds 11a-c, 12a-c, 14a-c, 15a-c, 16a-i \&17a-c.

After having 16a as "lead", we decided to further evaluate 16a to compare with standard drug isoniazid (INH). First we compared 16a with INH for their susceptibilities on 18 clinical isolates (Table 2) of MTB (M. tuberculosis), out of which 16 were pan-susceptible and 2 were monorifampin resistant isolates. We are glad to report that our compound 16a have been shown almost equipotent to that of INH. Having seen its potential, we decided to evaluate 16a against 9 multi drug resistant (MDR) and 2 poly-drug resistant MTB strains (Table-3). We are happy to report
that, compound have shown promising activity against almost all the resistant strains. The compound 16a is now under further evaluation stage, which shall be shortly communicated.

The inhibitory activity $\left(\mathrm{MIC}_{50}\right)$ was determined against M. tuberculosis H37Rv. The cidal activity $\left(\mathrm{MBC}_{90}\right)$ and cytotoxicity $\left(\mathrm{CC}_{50}\right)$ were determined after 5 days of exposure to a single dose of compound. Assays were carried out at least two times. $\mathrm{MIC}_{50}$ : Minimum Inhibitory Concentration 50\%; MBC ${ }_{90}$ : Minimum Bactericidal Concentration 90\%, $\mathrm{CC}_{50}$ : Cyototoxic concentration $50 \%$. n.d.: not determined.

The 16a susceptibilities were also tested on 9 multi-drug resistant (MDR) and 2 poly-resistant MTB strains. (b) Twenty of the twenty-five sensitive and resistant clinical isolates tested were previously determined to be genetically distinct by IS6110 genotyping. I, isoniazid; R, rifampin; S, streptomycin; EM, ethambutol; ET, ethionamide; K, kanamycin; P, pyrazinamide; Cl , ciprofloxacin; CA, capreomycin.

## CONCLUSION

Keeping XDR \& MDR tuberculosis at the background, current report reveals a series of molecules that have shown promising activity against the $\mathrm{H}_{37}$ strain. These easy to synthesise molecules will certainly be cheaper and can be synthesised in short duration. The compounds have also shown comparable activity against different 25 clinical isolates. These tractable molecules have been identified as "Hit" and our future matrix revolves around the modification and observing the SAR of the synthesised compounds. Finally, it may be concluded considering the activity of reported molecule that, Lepinski's rule of five can be bend and molecules which do not obey it, can be treated as drug candidates.
