#### Abstract

Series of non peptide angiotensin (A-II) receptor antagonist has been prepared by 4'-\{2-[4-[3-chloro-2-(substituted-phenyl)-4-oxo-azetidin-1-yl)-phenyl]-benzoimidazol-1-yl-methyl\}-biphenyl-2-carboxylic acid were synthesised by 2-(4-aminophenyl) Benzimidazole ( 0.01 mol ), substituted Benzaldehyde ( 0.01 mol ) and a drop of acetic acid was dissolved in ethanol ( 25 ml ) and heated on a steam bath for $45-60 \mathrm{~min}$ Chloroacetyl chloride ( 0.01 mol ) was added drop wise to a mixture of schiff base ( 0.01 mol ) and triethylamine ( 0.02 mol ) in dioxane ( 25 ml ) at room temperature Schiff bases react with biphenyl carboxylic acid with different substituents aryl group cyclocondensation with appropriate reagents. Different from the previously reported and related compounds in that they produce a potent hypertensive effect The compounds synthesised were identified by ${ }^{1} H$ NMR, ${ }^{13} C$ NMR, FAB Mass and FT-IR spectroscopic techniques. All compounds studied in this work were screened for their antihypertensive activity by tail cuff method and direct method measurement of Blood pressure.

Keywords: Benzimidazole, Azetidinone, Biphenyl Carboxylic acid, Angiotensin II, Blood Pressure.

## INTRODUCTION

Ang II receptor antagonists have proved to lower blood pressure effectively, and they are better tolerated than other classes of drugs. The renin-angiotensin system (RAS) plays a key role in regulating cardiovascular homeostasis and electrolyte/ fluid balance in normotensive and hypertensive subjects[1].Activation of the renin-angiotensin cascade begins with renin secretion from the juxtaglomerular apparatus of the kidney and culminates in the formation of the octapeptide angiotensin II (AII), which then interacts with specific receptors present in different tissues[2]. The octapeptide angiotensin II (Ang II) produced by the rennin angiotensin system (RAS) is a potent vasoconstrictor and thus plays an integral role in the pathophysiology of hypertension. This directed many researchers toward designing drugs to block the effects of Ang

II either by inhibiting the angiotensin converting enzyme (ACE) or renin or by blocking the Ang II receptors. Two basic types of receptors, both having a broad distribution, have been characterized so far: the AT1 receptor, responsible for the majority of effects attributed to this peptide, and the AT2 receptor, with a functional role yet uncertain [3]. The main effects of AII are the regulation of blood pressure through vasoconstriction, thereby affecting an increase in vascular resistance, the regulation of volemia through the stimulated release of vasopressin and aldosterone, which induces saline retention, and the regulation of the adrenocorticotropic hormone (ACTH) Thus, reducing the levels of AII by inhibition of one of the RAS enzymes or directly blocking the AII receptors is in theory a good approach for treating hypertension, confirmed by the success of angiotensin-converting enzyme (ACE) inhibitors as antihypertensive[4]. Hypertension is one of the most important cardiovascular risk factor but its control is still Challenge for physicians all around the world. Antihypertensive are a class of drugs that are used in medicine and pharmacology to treat hypertension (high blood pressure). All Hypertensive drugs cause dizziness, ankle swelling, headache, fatigue, chest discomfort and cough. This review focus on the adverse effects of Antihypertensive drugs, severity of these adverse effects and attempts made to prevention and treatment of hypertension by nonpharmacological intervention. Substantial effort has been made to find renin inhibitors, although orally active agents have only recently been reported[5].The discovery of potent and orally active nonpeptide Ang II antagonists such as losartan and eprosartan has encouraged the development of a large number of similar compounds[6]. Among them, irbesartan, candesartan, valsartan, telmisartan, tasosartan, and olmesartan are on the market. Most of the developed AT1 receptor antagonists are characterized by the presence in their structure of the biphenyl fragment bearing an acidic moiety and differ in the nature of the pendent heterocyclic system (valsartan lacks the heterocyclic moiety) connected to the para position of the proximal phenyl.Substantial effort has been made to find renin inhibitors, although orally active agents have only recently been reported[7] No less effort has been devoted to finding AII antagonists, which besides being the most direct way of controlling the RAS could have the additional advantage of lacking the side effects, such as cough and angioedema, observed with ACE inhibitors, as these are probably caused by partial inhibition of the cleavage of bradykinin and substance P. Starting from the initial leads reported by Takeda,[9] researchers at DuPont discovered losartan, the first orally active AT1 selective nonpeptide AII antagonist that reached the market for the treatment of hypertension (1994, Cozaar). The substituent at 6 -position on the nucleus increases the activity whereas small substituent at 5 -position decreases the activity[10]. Compounds containing tetrazole nucleus are also reported as AT1 receptor antagonists and their protypical derivative exhibits non-competitive antagonism[11] and amino group attach with carboxylic group given good biological activity [11-12]. In recent years, attention has increasingly been given to the synthesis of benzimidazole derivatives as a source of new antimicrobial agents. The synthesis of novel benzimidazole derivatives remains a main focus of medicinal research. Recent observations suggest that substituted benzimidazoles and heterocycles, which are the structural isosters of nucleotides owing fused heterocyclic nuclei in their structures that allow them to interact easily with the biopolymers, possess potential activity with lower toxicities in the antihypertensive activity approach.

## MATERIALS AND METHODS

Melting points were determined in open capillary tubes and are uncorrected. The time required for completion of the reaction was monitored by TLC using Silica gel-G plates and spots were exposed in iodine chamber. IR spectra were recorded on a Perkin Elmer 1800 (FTIR) spectrometer 1H NMR spectra (DMSO) were taken on a DRX-300 spectrometer ( 300 MHz ) using TMS as internal standard and chemical shifts are expressed in $\delta \mathrm{ppm}$.

General Method for the Synthesis [13]
A mixture of 2-(4-aminophenyl) Benzimidazole ( 0.01 mol ), substituted Benzaldehyde ( 0.01 mol ) and a drop of acetic acid was dissolved in ethanol ( 25 ml ) and heated on a steam bath for 45-60 min . The reaction mixture was allowed to stand at room temperature for 24 h , The product separated out was filtered, dried under vacuum and recrystallized by using warm Absolute ethanol.

## MS-02 Synthesis of 2-[4-(azetidin-2-one) 3-chloro-4-phenyl]-1H-phenylbenzimidazole

Chloroacetyl chloride $(0.01 \mathrm{~mol})$ was added drop wise to a mixture of schiff base $(0.01 \mathrm{~mol})$ and triethylamine $(0.02 \mathrm{~mol})$ in dioxane $(25 \mathrm{ml})$ at room temperature. The mixture was stirred for 8 h and allowed to stand at room temperature for 3 days. The contents were poured on crushed ice and the precipitate obtained was filtered, washed with $10 \% \mathrm{w} / \mathrm{v}$ sodium bicarbonate solution, vacuum dried and recrystallised using absolute ethanol.

## MS 03: (Biphenyl carboxylic acid)

35 gm of potassium hydroxide was heated at $170^{\circ}-192^{\circ} \mathrm{C}$ in a three necked flask until fusion. 12.5 gm of finely powdered of 9 H -Fluorenone was added in five portions over one and half hour with vigorous stirring and the temperature was maintained at $170^{\circ}-192^{\circ} \mathrm{C}$ for further one half hour. The fusion mixture was then poured in ice cold water with stirring. The obtained suspension was filtered at vacuum pump and then filtrate was acidify with HCl to $\mathrm{pH}-4.5$ resulting in precipitation of by product which was filtered under suction wash with distilled water and the filtrate was again acidify with $\mathrm{Con} . \mathrm{HCl}$. The precipitated product was filtered under suction and dried in air. The product was recrystallized from Absolute ethanol. Product MCS-04 was formed.

Yield: $81 \%$. m.p. $=145-148^{\circ} \mathrm{C} . \operatorname{IR}(\mathrm{KBr}): 3598-3069(\mathrm{O}-\mathrm{Hstr}), 1675.4(\mathrm{C}=\mathrm{O}$ Carboxylic, str), 1393, $1364.3(\mathrm{C}-\mathrm{O}-\mathrm{H}$ in-plane bend); 1H NMR(CDCl3): $10.03(1 \mathrm{H}, \mathrm{s}, \mathrm{COOH}), 7.41-8.21(1 \mathrm{H}, \mathrm{m}, 9 \mathrm{H})$, ${ }^{13} \mathrm{CNMR}\left(\mathrm{CDCl}_{3}\right) \delta: 112.4,116.8,126.8,133.5,162.8$, FABMS, 198.08(100\%), 199.06(14.5\%), 200.12(1.\%). ## MS-04: (4'-Acetylamino methyl biphenyl-2-caboxylic acid)

5 gm of MCS 03 was dissolved in 25 ml of concentrated $\mathrm{H}_{2} \mathrm{SO}_{4}$. After that acetamide ( 2.15 gm ) and Paraformaldehyde $(0.560) \mathrm{gm}$ were added subsequently. The solution was heated at $70^{\circ} \mathrm{C}$ along with stirring for 4.5 hours. The hot mixture was poured over ice and cold water. The precipitated product was filtered under suction and dried in air. The product was recrystallized from Absolute ethanol. The resulting solid was filtered out.

MS 05: (4'-Chloromethyl biphenyl-2-carboxylic acid)
1.4 gm of MCS-04 was taken in a RBF. 1.598 gm of phosphorus oxy chloride was added to 4 ml of DMF and further addition of xylene $(4 \mathrm{ml})$. The reaction mixture was refluxed for $71 / 2$ hours.

The cold solution was washed with water and evaporated to give a light yellow crystalline product.

## MS-06-4'-\{2-[4-(3-chloro-2-oxo-4-subsituted-azetidin-1-yl)-phenyl] benzoimidazol-1-yl-methyl\}-biphenyl-2-carboxylic acid

115 mg of MS-02 was dissolved in 20 ml of DMF (dimethyl formamide) and stirred vigorously with 5.78 gm of potassium carbonate at $35^{\circ} \mathrm{C}$ for three half hours. To the resulting mixture 0.482 gm of MCS-06 first dissolved in 20 ml of DMF and then was added drop wise with dropping funnel in 1 hour the reaction was allowed to proceed for further 8 hours at room temperature and solvent removed under vacuum. Residue was treated with 20 ml of dilute HCl and extracted with ethyl acetate. The organic layer was washed with water, distilled water and dried over anhydrous sodium sulphate. The solvent was evaporated and solid (MS-06) was obtained.

## Biological Activity: [12-19]

## Method [A]

Albino rats weighing 200-250 gm were used to screening for all the synthesizes benzimidazoles derivatives for antihypertensive activity. Suspension of test compound was prepared in $1 \% \mathrm{w} / \mathrm{v}$ sodium carboxy methyl cellulose and administered at dose level of $50 \mathrm{mg} / \mathrm{kg}$ animal body weight to different of five rats each group.Contorl group received an equal quantity of $1 \% \mathrm{w} / \mathrm{v}$ sodium carboxy methyl cellulose suspension. After administration of dose to animal, blood pressure was measured by Non-invasive Tail cuff Method using pressure meter.Measurment were done after 1 hour and 3 hour time interval intensive stepwise. One hour after administration of drug sample, animal was shifted to the restrainers, which restricts the movement of animal. The tail was cleaned with moist cotton to remove the dirty matter and talcum powder was sprayed on tail to make its surface smooth. A tail cuff and pulse transducer was fixed around the tail. Initially animal shows particular pulse level, when the pulse rate is within the normal range. 'STRAT' switch is put on and the recorder records the blood pressure as SBP (systolic blood pressure). DBP (Diastolic blood pressure) and MABP (mean arterial blood pressure), which is displayed on monitor. The pressure can be easily read from the pre-calibrated monitor. Once all the values are displayed the recorder is switched off and for next measurement. Some procedures are allowed once when sufficient pulse level is attained. Observations are given in the table1, 2.

## Method [B]

Male albino wistar ( $150-250 \mathrm{gm}$ ) rats were used and housed at $24 \pm 1^{\circ} \mathrm{C}$ room temperature. The rats were anaesthetized with sodium chloride $0.9 \%$ solution, Drug solution $10-\mu \mathrm{g} / 100 \mathrm{ml}$, and Heparin 500 I.U.solution urethane hydrochloride $50 \% \mathrm{w} / \mathrm{v}$ solution $80 \mathrm{mg} / \mathrm{kg}$ i.p. To set up the instrument firstly the level of mercury in the left arm of manometer was adjusted to $90-100 \mathrm{~mm}$ of Hg (normal blood pressure of rat).this was done in steps of 10 mm at a time and the physiogram so obtained was used as calibration graph for calculations. The Jugular vein and carotid artery were surgically cannulated for drug administration for recording the blood pressure respectively. The trachea was cannulated in order to provide artificial respiration to rat during the experiment. By means of three way stop cock and a stainless steel needle at the end of P.E. tubing was attached to arterial cannula for B.P., Transducers and the venus cannula to a syringe. Then both the cannulas were filled by heparinized saline before the administration. Arterial cannula was connected via transducer to physiograph recorder. Several baseline readings of systolic and diastolic pressures were recorded. The physiograph shows the reduction of the blood pressure with compare to losratan. Synthesized compounds were screened in presence of Angiotensin II induced hypertension ( $0.5 \mu \mathrm{~g} / \mathrm{kg}$ i.v.). Observations are given in the table 3, 4.

## RESULTS AND DISCUSSION

StepI, 2-(4-aminophenyl) Benzimidazole ( 0.01 mol ), substituted Benzaldehyde ( 0.01 mol ) and a drop of acetic acid was dissolved in ethanol ( 25 ml ) and heated on a steam bath for 45-60 min Chloroacetyl chloride ( 0.01 mol ) was added drop wise to a mixture of schiff base $(0.01 \mathrm{~mol})$ and triethylamine $(0.02 \mathrm{~mol})$ in dioxane $(25 \mathrm{ml})$ at room temperature. The mixture was stirred for 8 h and allowed to stand at room temperature for 3 days. Step II include the novel sequential combination of three routine reactions to synthesize $2^{\prime}$ - carboxybiphenyl methylene chloride. Biphenyl-2-carboxylic acid was prepared by potash fusion of 9 H flourenone which was then subjected to aromatic substitution reaction using paraformaldehyde and acetamide in conc. sulphuric acid to affect intermediate,4-acetamidomethyl biphenyl-2'-carboxylic acid. The required component was identified as third fraction which was subjected to substitution reaction with phosphorus oxychloride in xylene and dimethyl formamide to produce the pendant moiety 4-(bromomethyl) biphenyl-2'-carboxylic acid and synthesis biphenyl with carboxylic compound $[12,18$,$] . Almost all the newly synthesized substituted aryl group showed good antihypertensive$ activity with the goal of investigating the structure-activity relationships of benzimidazole and purity have been established through appropriate spectral and chromatographic techniques. The present work was mainly intended to establish the moieties which are responsible for Angiotension-II inhibition. Ang II antagonism by compounds with same functional group at 2 positions has been found to be a function of substitute aryl groups This suggests that there are some sites in the receptor pocket, which can interact with the functional groups at position 2Substituted benzimidazole nucleus coupled to carboxylic biphenyl group has been designed, synthesized and evaluated for angiotensin II antagonism. Biological activity of synthesized compounds was carried out using rat blood pressure measurement experiment. Taking Losartan as lead compound we had fused the benzene ring with imidazole and coupling reaction with 4chloromethyl biphenyl 2'- carboxylic acid to get the resulting compounds which shows hypertensive standard compared with our synthesis molecules activity. In the biphenyl ring carboxylic group at ortho position is necessary for pharmacological activity.

## Acknowledgement

The authors are thankful to Prof.Pratibha Sharma School of Chemical Sciences DAVV Indore, to given valuable suggestion to experimental work, authors also thankful to Head of Department School of Pharmacy D.A.V.V Indore to providing the facilities for IR spectra.
