

Emerging trends in the development of health care system through digital health innovation

Monika

Regulatory Affairs Specialist, Germany

Abstract

Today's health care informatics is the prime focused in the pandemic .Digital health care system is the new era in healthcare sector. Covid-19 pandemic expanded the adoption of digital health technology to the next level .With the rapid development of the technology people are going to monitor health in their own hands. Digital health informatics is the future for health care professions. The digital data generated from devices and software provides opportunities to enhance knowledge and understanding about health, illness and disease, and improve medical diagnosis and care.

Companies are focusing on developing software's via developing the app for individual support for individual care. Bayer's developed the APP ADA HEALTH PARTICULARLY ACCICIBLE FOR developed countries where's consumer can easily accessible the product list, treatment and the prevention. The technology is merged with health care industry and developed new opportunities for Global Health

DT Such as robotics process automation and artificial Intelligence improves quality of health at lower cost for ex Deloitte developed the data health care system for US Physicians to monitor the health care system in a smooth and advancing manner by eliminating busy work load. Digital technologies are increasingly used in medical training and other healthcare consumers to access, share and create health information of the patients. Data generated from devices and software provides opportunities to enhance knowledge and understanding about health, illness and disease, and improve medical diagnosis and care.
