Abstract

It is reported that a huge number of manual workers are highly exposed to hand injuries , specially finger tip injuries . Which are different in severity from mild into severe injuries. It found that most of finger tip injuries result in long term disabilities and decreased efficacy of the manual worker . Therefore, we had make a research about how severe is the effect of finger tip injuries . This presentation aims to spot light the fingertip injuries and how is the patient could manage after injuries . The presentation offers to give clinicians and others in the audience practical knowledge on mild and major disabilities post finger tip injury . And to present briefly the types of finger tip injuries among manual workers and the protocol of management of each of them .
