

Virus is living and its treatment

Kunal Joon

St .Thomas University, India

Abstract

Introduction: A viral test is done to find infection causing viruses .Viruses grows only in living cells. Viruses causes disease by destroying or damaging the cells they infect , damaging the body's immune system Changing the genetic material (DNA) of the cells they infect or causing inflammation that can damage an organ . Viruses cause many types of diseases, such as human immunodeficiency virus (HIV), cold sores, chicken pox, measles, flu and some types of cancer
