### Description

Health care is that the upkeep or improvement of health via the hindrance, diagnosis, treatment, recovery, or cure of illness, illness, injury, and various physical and mental impairments in people. Health care is delivered by health professionals and allied health fields. This study was a quasi-experiment with one group pretest-posttest design in which there were 80 subjects who were the first year naval nursing students studying the subject of health system at the royal Thai navy college of nursing. The research instruments consisted of the lesson plan, a test on nutrition and health, assignment details, an assessment form on ability to conduct researches and an assessment form relating to opinions on research-based instruction.

faculty and students learn about the Million Hearts initiative, conduct community screenings, and refer people who screen positive to appropriate resources. After completion of the module, individuals receive certification as a Million Hearts Fellow. More than 2,500 individuals from 80 colleges across the United States have accessed the module. More than 20,000 people have been screened. The module and screenings have been incorporated into health sciences curricula and community activities. Academic institutions and health science professions partnering together as part of the National Inter professional education and practice consortium to advance million hearts provide a unique opportunity to demonstrate the impact that a unified approach can have on improving population health through the use of screening, education, and prevention.

### t-Test Analysis

The collected data were analyzed using the descriptive statistics, paired-t test and content analysis. The results were as follows. Comparing to the norm (the norm was at 70% which was equivalent to the score of 56), the total average score of the first year naval nursing students in the subject of health system was in "good" level and higher after going through the research-based instruction. The average post-achievement score of the first year naval nursing students which was taken after conducting the research-based instruction was higher than the average pre-achievement score with statistical significance at .05. The responses from the first year naval nursing students on conducting researches were rated high both on individual items and as a whole.

We used data from 2380 nursing home residents in 6 government-funded long-term care facilities managed by a nongovernmental organization (NGO) in Hong Kong. Annual MDS data were available from 2005 to 2013. Only residents who were 65 years or older in their first interviews were included. Using variables from the MDS, a quick screening tool for frailty in nursing homes, the FRAIL-NH, has been validated with demonstrated predictive power for major adverse health outcomes. The tool provides a simple solution to identify residents who are at risk of becoming frail, with minimal extra resources required or assessment burden in long-term care facilities using the MDS health information system.

### Health Profession Regulatory Collaborative

Medicine, dentistry, pharmacy, midwifery, nursing, optometry, audiology, psychology, therapy, physiatrist, coaching and various health professions square measure all a vicinity of health care. It includes work drained providing treatment, secondary care, and tertiary care, additional as publicly health. Million Hearts is a national initiative to prevent 1 million heart attacks and strokes by 2017 by screening and educating the public on the "ABCS" of cardiovascular health. Million Hearts is an innovative platform for educating nursing and health sciences students on the importance of population health and inter professional teamwork. The National Inter professional education and practice consortium to advance million hearts was created, and a free on-line educational module was developed to help health care professionals and health sciences

The African Health Profession Regulatory Collaborative (ARC) was launched in 2011 to help countries develop or strengthen nursing regulations to ensure safe and sustainable nurse-initiated and nurse-managed HIV treatment. ARC supports teams of national nursing leaders from 17 countries to engage in rapid regulatory strengthening through regional meetings, regulation improvement grants, and in-country technical assistance. The ARC initiative has awarded 33 regulation improvement grants on topics such as continuing professional development, scopes of practice, nurse practice acts, and entry-to-practice examinations. Progress is measured by a novel tool that captures meaningful advancements in national regulations. The ARC initiative facilitates rapid improvements in professional

nursing regulation. The model and evaluation framework are highly transferable to other health care cadres and offer a platform for regulators, policy makers, professional bodies, and educators to collaborate on prioritized regulation issues.

Primary care is typically used as a result of the term for the health care services that play employment among the world folks. It's usually provided in various settings, like imperative care centers that provide same-day appointments or services on a walk-in basis. Primary care involves the widest scope of health care, alongside all ages of patients, patients of all socioeconomic

and geographic origins, patients seeking to stay up best health, and patients with all kinds of acute and chronic physical, mental and social health issues, alongside multiple chronic diseases.

Consequently, a treatment professional ought to possess an outsized breadth of knowledge in many areas. Continuity can be a key characteristic of treatment, as patients generally choose to consult the same professional for routine check-ups and preventive care, health education, and every time they have Associate in nursing initial consultation a few of recent unhealthiest.
