Abstract

GENEIDO, a novel pathogen DNA analysis software accurately predicted COVID-19 symptoms as early as in February 2020. Its accuracy was proven to be above 90% in November 2020. GENEIDO suggested that there were THREE types of SARS-CoV2 viruses existed from the beginning. They could invade the lungs, lower brain/CNS functions, affect kidney, liver and the heart. Their symptoms vary, for example, only some cause fever, some cause pus or sputum accumulation in the lungs, some cause diarrhea, and none of them has all the symptoms. These variations would lead to confusions in the medical world and the drug/vaccine industries. GENEIDO was developed based on our knowledge in DNA, embryology and Chinese Medicine. It tells us the health impacts a pathogen may create in human body. GENEIDO is easy to understand and operate by all medical providers. It provides analysis results in real-time, which means seconds after the pathogen genome sequences are available. Most importantly, it enables both Conventional and Alternative Medicine Practitioners to treat and prevent infectious diseases using their remedies. In the conference, I will show you the analysis results of all three types of SARS-CoV2 viruses, including the latest Delta variant, together with other pathogens such as Plasmodium falciparum 3D7, chromosome 1 (Malaria) and Clostridium tetani E88 (Tetanus). I will also share my experiences and acupuncture formula in treating H1N1.

Biography

Mai Wang, DAOM, BE, is the CEO of Rivermap Research Consulting LLC in Hawaii, USA. Dr Wang has a unique integrative background in Computer Engineering and Traditional Chinese Medicine. Dr Wang started her research in Pathogen Genome Analysis in 2007. She invented the Rivermap DNA Model and the novel Pathogen DNA Analysis Software called GENEIDO, which predicts the health impact of pathogens that may create in humans.

She accurately predicted the symptoms of H1N1 in May 2009 & COVID-19 in February 2020. Dr Wang also teaches Shang Han Lun and Wen Bing at the Institute of Clinical Acupuncture and Oriental Medicine, Hawaii. She believes the cross-pollination of modern DNA technology and traditional healing arts will enable practitioners to better understand pathogens and therefore become more effective in practice.
