

# Proinsulin-transferrin fusion protein: An insulin analog to achieve both livertargeting and overcoming insulin resistance

Wei-Chiang Shen University of Southern Califonia, USA

## Abstract

We have recently prepared a recombinant proinsulintransferrin fusion protein (ProINS-Tf). ProINS-Tf is an inactive form of insulin analog, but can be selectively absorbed, activated, and retained in the liver. We have demonstrated in type 1 diabetes mouse models that ProINS-Tf is a highly livertargeted and long-lasting insulin prodrug. Due to the binding to both insulin and transferrin receptor, the liver-activated ProINS-Tf exhibited a significantly higher affinity to insulin receptor when compared with the native insulin. The bivalent binding of activated ProINS-Tf induces a longer and stronger activation of insulin receptor as demonstrated in the enhanced and prolonged Akt phosphorylation with cells. Furthermore, ProINS-Tf hepatoma overcome insulin resistance in palmitate-treated HepG2 cells, as well as in severe hyperglycemic NOD mice. Therefore, ProINS-Tf can potentially be developed into a safe and effective insulin prodrug for the control of basal glycaemia in diabetes and for the treatment/prevention of insulin resistanceassociated diseases

School Of Pharmacy. His research interests focus on the development of novel systems for improving peptide and protein drug delivery. He has published more than 150 papers in different areas of biomedical sciences. He is a Co-Author of the textbook "Immunology" for Pharmacy Students and a Co-editor of the book "Antibody-Drug Conjugates – the 21st Century Magic Bullets for Cancer". He was elected to Fellow of the American Association of Pharmaceutical Scientists in 1992 and Fellow of the American Association for the Advancement of Sciences in 2000.
