

# Risk factors for bacteremia in severely malnourished pneumonic children and their outcome

**Abu Sadat Mohammad Sayeem Bin Shahid**

International Centre for Diarrhoeal Disease Research, Bangladesh

## Abstract

Bacteremia is quite common in Severe Acute Malnourished (SAM) children with pneumonia, who often experience a fatal outcome, especially in developing countries. There is limited information in the medical literature on the risks of bacteremia in SAM children with pneumonia. We have examined the factors associated with bacteremia and their outcome in under-five children who were hospitalized for the management of pneumonia and SAM
