

## ***Study on “Impacts of climate change on Asian countries government management practices stretching the poverty, revenues and debts in all economies”.***

VenkataNageswara Reddy  
SDGs Professional Consultant, India

### ***Abstract:***

Global growth both in population and industrial practices brought magnificent changes in local climate, which is alarming the sustainable management practices of all economic bounded communities (Household, Business, governance etc) in all continents on the planet. Asian continent, which is a galaxy of small nations and Islands with around 4.5 billion population, is stretching the management practices in all economic zones. The toxic pollutions are mounting year by year in all these nations and transferring to ocean floor (surface) and worsened the five elements (Air, Water, Soil, Clouds and temperatures) of nations, whose interventions are vital for securing income of daily earners (labor, farmers, private ad self-employees etc). Also, axed the network (distribution) system (dealer, distributor, service providers etc) of organizational operations. To fill these gaps, the intervention of governments for protecting poor (Below Poverty Line) widens their debts to allocate funds for social welfare schemes and subsidies, which laden the per capita debts and reversed the GDP growth. To overcome these crises, governments are imposing taxes on “prompt middle class payers”. This paper elevates the adopting and implementing solution(s) to Climate Change for reducing poverty and hunger I their economies.
