Sharma ${ }^{\text {c }}$<br>${ }^{a}$ Department of Pharmaceutical Sciences, Dr. Hari Singh Gaur University, Sagar (M.P), India<br>${ }^{b}$ Department of Chemistry, Yadhunath Mahavidyalya, Bhind (M.P), India<br>${ }^{c}$ Oriental College of Pharmacy, Indore (M.P), India

#### Abstract

Structures of all the synthesized compounds have been corroborated on the basis of elemental IR, ${ }^{1} H$ NMR, ${ }^{13} C$ NMR and Mass spectro-analytical data. Many Schiff bases were prepared by condensation reaction of compounds containing biphenyl carboxylic acid with aromatic aryl aldehydes derivatives with Thiazoldine-4-one. The synthesized compounds 4'-\{2-[4-[2-(Substituted-phenyl)-4-oxo-thiazolidin-3-yll-phenyl\} benzoimidazol-1-ylmethylj-biphenyl-2carboxylic acid react with mercaptoacetic acid and 4'-bromomethylbiphenyl-2-carboxylic acid and all synthesis compounds screened for Angiotension (A II) Receptor Antagonist antihypertensive activity with biphenyl carboxylic acid Schiff bases Thiazoldine-4-one shows good activity compared with losartan and Telmisartan.

Keywords: Biphenyl carboxylic acid, Thiazoldine-4-one, Angitotensin II, antihypertensive drug, Losartan, Telmisartan.

## INTRODUCTION

The renin angiotensin system (RAS) is one of the most powerful regulators of blood pressure and volume homeostasis in mammals. Its effector peptide angiotensin II (ANG II) is cleaved from the decapeptide angiotensin I by the metalloprotease ACE.[1-2] ANG II mediates all the effects of RAS after binding to its G-protein-coupled angiotensin II type $1\left(\mathrm{AT}_{1}\right)$ receptor and thus plays a complex role in the regulation of blood pressure fluid and electrolyte homeostasis. More recently ANG II was shown to regulate vascular tone by delayed effects on vascular smooth muscle via growth stimulation aldosterone production and release leading to increased salt absorption in the kidney and gut and the induction of thirst and sodium appetite in the brain. It
also stimulates the release of vasopressin luteinizing hormone oxytocin and corticotropin. ANG II further induces vagus suppression and $\alpha$-adrenergic potentiation and increases inotropy and chronotropy. Stimulation of the cardiac fibroblast matrix formation has also been described [35]. ANG II stimulates synthesis of prostaglandin [6] endothelin [7] and elicits procoagulatory effects by activating the plasminogen activator (PA) plasmin system [8-11]. The beneficial effect of a chronic RAS blockade was first shown for inhibitors of the angiotensin converting enzyme (ACE) such as captopril quinapril enalapril and ramipril in patients with ischemic heart disease congestive heart failure the development of potent drugs that interfered with the RAS: the angiotensin receptor type $1\left(\mathrm{AT}_{1}\right)$ antagonists[12]. To find a more specific blockade of ANG II at its $\mathrm{AT}_{1}$ receptor highly selective non-peptidic $\mathrm{AT}_{1}$-receptor antagonists were designed and developed as competitive antagonists with virtually no agonistic effect at the receptor level. Losartan was described as the first non-peptide $\mathrm{AT}_{1}$ receptor antagonist and the coined group name was sartans. All major pharmaceutical companies embarked on a fast follower program immediately thereafter [13-16]. Today irbesartan candesartan and valsartan are all established in the market and others e.g. tasosartan and telmisartan are following closely. Some further 20 compounds are in development. Most of these compounds share the biphenyl tetrazole unit or replacements thereof with the original advanced lead Losartan [17]. Some 12000 variations of the parent biphenyl tetrazole alone were reported in the meantime excluding the obvious variation of the biphenyl spacer. The carboxylic acid another common moiety of the sartans appears to establish another important interaction with the receptor but it often hampers oral absorption. Therefore several prodrug concepts had to be realized to mask the carboxylic acid as either a labile ester or an oxidatively labile precursor that delivers the acid after absorption. Recent findings [18-19] indicate the involvement of this peptide also in situations concerning tissue remodelling, such as cardiac hypertrophy and cancer. All these responses are mediated by two distinct subtypes of Ang II receptors [type $1\left(\mathrm{AT}_{1}\right)$ and type $2\left(\mathrm{AT}_{2}\right)$ ]. In particular, $\mathrm{AT}_{1}$ receptors mediate all of the known effects associated to Ang II that constitutes the principal target of an effectiveness therapy against the cardiovascular pathology. The Ang II effects may be reduced by inhibiting almost partially the enzyme responsible of biosynthesis of Ang II or through the interaction with $\mathrm{AT}_{1}$ receptor. To date, many orally available sartans have been developed and are used in the treatment of both hypertension and damage associated with diseases like atherosclerosis and diabetes. In particular, the good properties of new non peptide Ang II antagonists, such as losartan, have stimulated the design of many different congeners. All these drugs contain some common structural features represented by a biphenyl fragment bearing an acidic moiety (i.e.: tetrazole, carboxylic- or sulphonamidocarboxyl- group), linked to a heteroaromatic or acyclic system by means of a methylene group. Almost all of the chemical manipulations within the fundamental skeleton of sartans concerned the substitution of the imidazole ring of losartan with several variously substituted heteroaromatic groups or acyclic structures[20].All these antagonists possess a central aromatic nucleus bearing the pharmacophores indispensable for activity and notably a polar function adjustant to biphenyl subsistent while a polar function in this area of molecule seems to be necessary to maintain activity[21]Sartans are appropriately substituted heterocyclic head coupled through a methylene linker to pendent biphenyl system bearing an acidic function; viz. candesartan is an effective competitive Ang II antagonist with benzimidazole nucleus as the heterocyclic head [22]. The subsistent at 6 -position on the nucleus increases the activity whereas small substituent at 5position decreases the activity [23] compounds containing tetrazole nucleus are also reported as $\mathrm{AT}_{1}$ receptor antagonists and their protypical derivative exhibits non-competitive
antagonism[24] amino group attach with carboxylic group given good biological activity [2527].In recent years, attention has increasingly been given to the synthesis of benzimidazole derivatives as a source of new antihypertensive agents. The synthesis of novel benzimidazole derivatives remains a main focus of medicinal research. Recent observations suggest that substituted benzimidazoles and heterocyclic, which are the structural isosters of nucleotides owing fused heterocyclic nuclei in their structures that allow them to interact easily with the biopolymers, possess potential activity with lower toxicities in the chemotherapeutic approach in man [28-29]. Moreover, these fused heterocyclic were distinctively studied for their antihypertensive activity, antitumor, antiviral and antimicrobial activities as the new nonnucleoside topoisomerase I poisons, human immunodeficiency virus-1 reverse transcriptase inhibitors and or potent DNA gyrase inhibitors [30-31]. In addition, benzimidazole derivatives have played a crucial role in the theoretical development of heterocyclic chemistry and are also used extensively in organic synthesis.

## MATERIALS AND METHODS

Moreover, most of the methods have not been found to be quite accessible from the viewpoints of both yield and economics of the reaction. Thus, in order to cater the needs associated with synthetic aspects, herein, we would like to present unique approach to synthesize benzimidazole derivatives. Melting points were determined in open capillary tubes and are uncorrected. The time required for completion of the reaction was monitored by TLC using Silica gel-G plates and spots were exposed in iodine chamber. IR spectra were recorded on a Perkin Elmer 1800 (FTIR) spectrometer 1H NMR spectra (DMSO) were taken on a DRX-300 spectrometer ( 300 MHz ) using TMS as internal standard and chemical shifts are expressed in $\delta \mathrm{ppm}$.

## Synthesis of 1H-benzimidazol-2-amine

A solution of 1,2-phenylenediamine dihydrochloride ( $0.45 \mathrm{~g}, 2.5 \mathrm{mmol}$ ) in 5 ml of water was cooled to $0^{\circ} \mathrm{C}$ and treated with a solution of cyanogen bromide $(0.60 \mathrm{ml}, 5 \mathrm{M}$ in acetonitrile, 3.0 $\mathrm{mmol})$ and solid $\mathrm{NaHCO}_{3}(0.41 \mathrm{mg}, 4.9 \mathrm{mmol})$. The solution was stirred at ambient temperature for $40-45 \mathrm{~h}$. The mixture was made basic with 1 M aqueous $\mathrm{Na}_{2} \mathrm{CO}_{3}$ and the solution was concentrated under reduced pressure. The residue was triturated with hot ethanol, and the ethanolic solution was filtered and concentrated under reduced pressure to obtain the compound 1 in appreciable yield.

Yield $85 \%$; mp 135-136 ${ }^{\circ} \mathrm{C}$; Anal Calcd for $\mathrm{C}_{7} \mathrm{H}_{7} \mathrm{~N}_{3}(\mathrm{R}=\mathrm{H}): \mathrm{C}, 63.14 ; \mathrm{H}, 5.30 ; \mathrm{N}, 31.56 \%$; Found: C, 63.10; H, 5.28; N, 31.53\%; IR ( $\mathrm{v} \mathrm{cm}^{-1}$ ): $3045\left(\mathrm{C}-\mathrm{H}, \mathrm{sp}^{2}\right), 3210(\mathrm{NH}$, bonded), 3175 (NH, free), $1654(\mathrm{C}=\mathrm{N}), 1626,1586,1444\left(\mathrm{C} \cdots \mathrm{C}\right.$, ring str) 958, 859, 742 (sub. phenyl); ${ }^{1} \mathrm{H}$ NMR ( $300 \mathrm{MHz}, \mathrm{CDCl}_{3}$ ) $\delta: 4.0\left(\mathrm{~s}, 2 \mathrm{H}, \mathrm{NH}_{2}\right), 5.0(\mathrm{~s}, \mathrm{NH}), 7.6-7.9(\mathrm{~m}, 4 \mathrm{H}, \mathrm{Ar}-\mathrm{H}) ;{ }^{13} \mathrm{C} \operatorname{NMR}\left(\mathrm{CDCl}_{3}\right)$ $\delta: 117.41,124.34,136.66,158.62 ;$ FAB-MS: $134(\mathrm{M}+\mathrm{H})^{+}$.

## Synthesis of 4-(1H-Benzimidazole-2-yl)-phenyl]-benzylidene-amine)

A mixture of 2-(4-aminophenyl) Benzimidazole ( 0.01 mol ), substituted Benzaldehyde ( 0.01 mol ) and a drop of acetic acid was dissolved in ethanol ( 25 ml ) and heated on a steam bath for 45-60 min . The reaction mixture was allowed to stand at room temperature for 24 h ; the product separated out was filtered, dried under vacuum and recrystallized by using warm Absolute ethanol.

## Synthesis of 3-[4-(1H-Benzimidazole-2-yl)-phenyl]-substituted -phenyl-thiazolidin-4-one

To a mixture of Schiff base ( 0.01 mol ) and mercaptoacetic acid ( 0.05 mol ) dissolved in dioxane $(50 \mathrm{ml})$, anhydrous zinc chloride ( 0.008 mol ) was added and refluxed for 12 hrs . The reaction mixture was cooled, filtered, washed with $10 \%$ w/v sodium bicarbonate solution, vacuum dried and recrystallised using absolute ethanol, Compounds [1-18].

## Synthesis of (Biphenyl Carboxylic acid) [37-38]

35 gm of potassium hydroxide was heated at $170^{\circ}-192^{\circ} \mathrm{C}$ in a three necked flask until fusion. 12.5 gm of finely powdered of 9 H -Fluorenone was added in five portions over one and half hour with vigorous stirring and the temperature was maintained at $170^{\circ}-192^{\circ} \mathrm{C}$ for further one half hour. The fusion mixture was then poured in ice cold water with stirring. The obtained suspension was filtered at vacuum pump and then filtrate was acidify with HCl to pH 4.5 resulting in precipitation of by product which was filtered under suction wash with distilled water and the filtrate was again acidify with Conc. HCl . The precipitated product was filtered under suction and dried in air. The product was recrystallized from Absolute ethanol. Product was formed.

## Synthesis of (4'-Acetylamino methyl biphenyl-2-caboxylic acid)

5 gm of MCS 03 was dissolved in 25 ml of concentrated $\mathrm{H}_{2} \mathrm{SO}_{4}$. After that acetamide ( 2.15 gm ) and Paraform aldehyde $(0.560) \mathrm{gm}$ were added subsequently. The solution was heated at $70^{\circ} \mathrm{C}$ along with stirring for 4.5 hours. The hot mixture was poured over ice and cold water. The precipitated product was filtered under suction and dried in air. The product was recrystallized from Absolute ethanol. The resulting solid was filtered out.

## Synthesis of 4'-chloromethylbiphenyl-2-carboxylic acid [37-38]

1.4 gm of MCS-04 was taken in a RBF. 1.598 gm of phosphorus oxy chloride was added to 4 ml of DMF and further addition of xylene $(4 \mathrm{ml})$. The reaction mixture was refluxed for $71 / 2$ hours. The cold solution was washed with water and evaporated to give a light yellow crystalline product.

## Synthesis of 4'-\{2-[4-[2-(Substituted-phenyl)-4-oxo-thiazolidin-3-yl]-phenyl\} benzoimidazol-

 1-ylmethyl\}-biphenyl-2-carboxylic acid100 mg of Schiff base (different substituted aryl aldehydes MCS-02) was dissolved in 50 ml of DMF (dimethyl formamide) and stirred vigorously with 12.5 gm of potassium carbonate at $39^{\circ} \mathrm{C}$ for 4 hours. To the resulting mixture 0.482 gm of MCS-03 first dissolved in 15 ml of DMF and then was added drop wise with dropping funnel in 4 hours the reaction was allowed to proceed for further 12 hours at room temperature and solvent removed under vacuum. Residue was treated with 20 ml of Conc. HCl and extracted with ethyl acetate. The organic layer was washed with water, distilled water and dried over anhydrous sodium sulphate. The solvent was evaporated and solid (MCS-04) was obtained.

## SCHEME

COMPOUNDS-[1-18]

## Biological Activity

Non-invasive Tail cuff Method (Indirect Method) [25, 33-37]-Albino rats weighing 150-200 gm were used to screening for all the synthesized benzimidazoles derivatives for antihypertensive activity. Suspension of test compound was prepared in $1 \% \mathrm{w} / \mathrm{v}$ sodium carboxy methyl cellulose and administered at dose level of $50 \mathrm{mg} / \mathrm{kg}$ animal body weight to different of five rats each group.Contorl group received an equal quantity of $1 \% \mathrm{w} / \mathrm{v}$ sodium carboxy methyl cellulose suspension. After administration of dose to animal, blood pressure was measured by Non-invasive Tail cuff Method using pressure meter.Measurment were done after 1 hour and 3 hour time interval intensive stepwise. One hour after administration of drug sample, animal was shifted to the restrainers, which restricts the movement of animal. The tail was cleaned with moist cotton to remove the dirty matter and talcum powder was sprayed on tail to make its surface smooth. A tail cuff and pulse transducer was fixed around the tail. Initially animal shows particular pulse level, when the pulse rate is within the normal range. 'STRAT' switch is put on and the recorder records the blood pressure as SBP (systolic blood pressure). DBP (Diastolic blood pressure) and MABP (mean arterial blood pressure), which is displayed on monitor. The pressure can be easily read from the pre-calibrated monitor. Once all the values are displayed the recorder is switched off and for next measurement. Some procedures are allowed once when sufficient pulse level is attained. [Table1, 2]

## RESULTS AND DISCUSSION

Tail-cuff non-invasive blood pressure measurements can be consistent, accurate and reproducible when studying awake and anesthetized mice and rats. Care must be exercised to properly handle the animals. Training the animals and monitoring the animal's temperature may also be beneficial. The volumetric pressure recording method provides the highest degree of correlation with telemetry and direct blood pressure and is clearly the preferred tail-cuff sensor technology. Non-invasive blood pressure devices that utilize Volume Pressure Recording are a valuable tool in research and will continue to be beneficial in many study protocols. The main advantages are: (1) they require no surgery; (2) they are significantly less expensive than other blood pressure equipment, such as telemetry; (3) they can screen for systolic and diastolic BP changes over time in large numbers of animals; and (4) they provide the researcher with the ability to obtain accurate and consistent blood pressure measurements over time in long-term studies.1,2-
phenylenediamine dihydrochloride $(0.45 \mathrm{~g}, 2.5 \mathrm{mmol})$ in 5 ml of water was cooled to $0^{\circ} \mathrm{C}$ and treated with a solution of cyanogen bromide ( $0.60 \mathrm{ml}, 5 \mathrm{M}$ in acetonitrile, 3.0 mmol ) and solid $\mathrm{NaHCO}_{3}(0.41 \mathrm{mg}, 4.9 \mathrm{mmol})$. The solution was stirred at ambient temperature for $40-45 \mathrm{~h}$. The mixture was made basic with 1 M aqueous $\mathrm{Na}_{2} \mathrm{CO}_{3}$ and the solution was concentrated under reduced pressure. 2-(4-aminophenyl) Benzimidazole ( 0.01 mol ), substituted Benzaldehyde ( 0.01 $\mathrm{mol})$ and a drop of acetic acid was dissolved in ethanol $(25 \mathrm{ml})$ and heated on a steam bath for $45-60 \mathrm{~min}$, To a mixture of Schiff base ( 0.01 mol ) and mercaptoacetic acid ( 0.05 mol ) dissolved in dioxane ( 50 ml ), anhydrous zinc chloride ( 0.008 mol ) was added and refluxed for 12 hrs . The reaction mixture was cooled, filtered, washed with $10 \% \mathrm{w} / \mathrm{v}$ sodium bicarbonate solution. 100 mg of Schiff base (different substituted aryl aldehydes) was dissolved in 50 ml of DMF (dimethyl formamide) and stirred vigorously with 12.5 gm of potassium carbonate at $39^{\circ} \mathrm{C}$ for 4 hours. To the resulting mixture 0.482 gm of MCS-03 first dissolved in 15 ml of DMF and then was added drop wise with dropping funnel in 4 hours the reaction was allowed to proceed for further 12 hours at room temperature and solvent removed under vacuum. Residue was treated with 20 ml of Conc. HCl and extracted with ethyl acetate. The benzimidazole derivatives were able to increases Angiotensin-II induced hypertension and also vasoconstriction, compared with Losartan and Telmisartan. The similar results were noticed with synthesized Schiff bases and Thiazoldine -4 -one. From the preliminary screening the synthesized molecules shows good Angiotensin II induced anti hypertension activity and above molecules can be taken as a lead molecule for Angiotensin II induced hypertension. Therefore we conclude in our preliminary screening that it may not to be necessary to go for a synthesis of big molecule [compounds numer- $2,6,8,9,11,13,15,17]$. Further study of these molecules and its analogues under progress in our laboratory.

## Acknowledgement

The authors are thankful to Head of Department School of Pharmacy D.A.V.V Indore to providing the facilities for IR spectra.
