

24th International Conference on Immunology & Infectious Diseases

Mr. Naif Alanazi

Assistant Professor, Department of Geriatrics, Kingdom of Saudi Arabia, Riyadh, E-mail: alenezina@outlook.com

[The immunology of infectious sickness](#) involves research of how the immune gadget responds to infectious agents and the way infectious agents engage with, adjust or evade the immune device. In recent years there have been essential advances in our expertise of the immune reaction to infection. One of the foremost advances has been the recognition of the link between the innate and adaptive immune structures in responding to infection. Mammalian cells worried in innate immune defenses have pattern reputation receptors that allow the host to detect conserved functions of infectious agents along with viral nucleic acid or bacterial cell wall components. These pattern reputation receptors are important for activating the innate immune gadget and rendering cells known as antigen-providing cells able to activate T cells of the adaptive immune gadget. There is currently much interest in information how the immune gadget acknowledges different functions of infectious agents and the way it translates these alerts to allow the appropriate immune reaction to effectively manipulate the pathogen.

Immunology research tends to a captivating medium for the introduction, information and explanation of complicated sensible information. Data appears as interpretive combo diagrams, incredible research articles, symposia, arrangements and theoretical structures.

Mr. Naif Alanazi gives a talk on "Biopsychosocial Characteristics and Functional Status among the Elderly in Riyadh, Saudi Arabia"

Go along with us to observe significant logical discourses and add to the future headways in the field of Immunology and Infectious Disease in the up and coming "24th Edition of International Conference on Immunology and Infectious Diseases" which will be sorted out during June 15-16, 2020 in London, UK.

Regards

Amelia Taylor
