Editorial Note

I am glad to present the Volume 9, Issue 3 of the journal on behalf of the Board of American journal of computer science and engineering survey and co-editors. American journal of computer science and engineering survey is having International Standard Serial Number (ISSN) of 2349-7238. American journal of computer science and engineering survey is imedpub publisher.

The Editorial Board is a group of scientific experts in the journal's field. Editorial board members promote the journal to their colleagues and peers. Assist the editors in decision making over issues such as plagiarism claims and submissions where reviewers can't agree on a decision.

The scope of Editorial Notes in Computer Science covers Computer Science (miscellaneous), Theoretical Computer Science, Bioinformatics, Cloud Computation, Computational Sciences, Data Mining, Machine Learning, Mathematical Modeling, Cryptography, Neural Network, Robotics Research, etc.

American journal of computer science and engineering survey functions on principles of scientific excellence, publication ethics and transparency. It makes the authors easy to submit their articles through the online manuscript submission and review system managed by imedpub as the publisher. Journal follows strict guidelines related to publication ethics and conflict of interests.

Manuscripts are sent to the preliminary check soon after the author submitted the article. Decision will be known within few hours of its initial submission. Later editorial board members will be assigned and reviewers will be assigned for the review process.

Manuscripts are reviewed at the editor-in-chief, senior editor, and associate editor levels before being sent out to reviewers. At any of these stages an editor may reject the manuscript or send it back to the author for improvement. Review comments received from the reviewer will be sent to the author and timely updates regarding the review process will be notified to the author. In the case of immediate revision, authors are given a chance to provide an enhanced manuscript to the eventual reviewers, thus increasing the odds of acceptance. Associate

editors complete a short evaluation for each reviewer on each manuscript. This process reminds reviewers that they are responsible for timely, high-quality reviews and also serves to help identify future associate editor candidates.

All manuscripts including editorials are subjected to peer review process. Members of the editorial board also prefer to submit their articles at many instances. In fact, IPACSES encourages editorial board members to actively contribute. However, no special privileges are given to anyone.

This journal is indexed in the source information for data aggregation may originate from public records and criminal databases The data is then compiled into aggregate reports and sold to corporations, as well as local, state, and federal government entities. This data can be used for marketing purposes as well. Many data brokers' actions in the United States are governed by the Fair Credit Reporting Act (FCRA), which governs consumer reporting organizations. Personal information is then gathered and packaged into consumer reports, which are sold to creditors, employers, insurers, and other corporations.

Database aggregators provide a variety of information reports. Individuals can obtain their own consumer reports, which include basic biographical information including their name, date of birth, current address, and phone number. Employee background check reports, which include extremely specific information such as previous residences and length of residency, professional licenses and criminal history, are available to eligible and approved third parties. This information can be utilized for a variety of purposes, including background checks for employees, insurance coverage, pricing, and law enforcement. Database aggregators, according to privacy advocates, may supply inaccurate data.

Consumers can use one master PIN on a single website to access a variety of PIN-protected websites containing personal information, allowing them to access a variety of PIN-protected websites containing personal information. Financial organizations, stockbrokers, airline and frequent flyer and other reward programs and e-mail accounts are all examples of online account providers. Using account users' PINs, data aggregators can collect account or other information from designated websites.
