

Women, trauma and alcohol dependency: Connections and disconnections in alcohol treatment for women

Junna Kunii

Department of Nursing, School of Health Science, Japan University of Health Sciences Saitama Japan

Abstract:

Nurses are by nature entrepreneurs although we don't typically think of ourselves in this manner. A gap exists in nursing provider knowledge on the process and pathway to medical device development. This talk will highlight the pathways to production that are required and

suggest partnerships that are little known to care providers to facilitate device development. This presentation outlines the steps and stages of device development from protecting intellectual property to licensing and manufacturing the product. This will provide a guide for those

interested, who have ideas for medical devices or improvements on current devices. Very limited literature is available on the entire process and as this area is not one typically taught in nursing programs, a knowledge deficit is present for potential inventors or entrepreneurs. The development process will be brought to light and offer suggestions on common areas where stumbling blocks persist, such as funding and licensing in the later stages of

development. The desired state is one that allows nurses a beginning to moderate level of knowledge on the process and pathways to be successful in medical device development from one patented developer's, nursing perspective.
